SUMMARY

I am a backend developer focused on DevOps with two years of production experience in AWS. I improve cloud reliability and cost efficiency through infrastructure automation, CI/CD, observability, and event-driven systems, using Python, Terraform, and Docker.

TECHNICAL SKILLS

- **Languages & Backend:** Python, TypeScript, Node.js, FastAPI, NestJS, REST APIs
- **Cloud & Infrastructure:** AWS Lambda, S3, SQS, EC2, RDS, IoT Core, CloudWatch, Terraform, Docker, Linux
- **CI/CD & Automation:** GitHub Actions, Bash, automated deployments, source control workflows, infrastructure as code
- **Databases:** PostgreSQL, MySQL, DynamoDB
- **Distributed Systems & Observability:** Event-driven architecture, MQTT, queues, load-aware async processing, Prometheus, Grafana, CloudWatch
- **Testing:** pytest, Jest, Testcontainers, unit tests, integration tests

EXPERIENCE

Backend Developer - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 10/2026 - Present

- Lead the consolidation of multiple AWS Lambda functions into a single FastAPI API organized into services and repositories, reducing deployment time from approximately 12 to 5 minutes and latency on several endpoints from 7–10 seconds to approximately 1.5 seconds (79–85%).
- Redesigned AWS network architecture, replacing multiple VPC endpoints with a NAT Gateway and adding an EC2 bastion for database access, reducing monthly network costs by approximately 64% (US$90 to US$32) and expanding Lambda connectivity.
- I am restructuring the MySQL schema of a production IoT platform, remodeling entities, relationships, and migration flows to better reflect the domain and preserve integrity and compatibility during transition.

Backend Developer Intern - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 10/2024 - 09/2026

- Structured infrastructure as code with Terraform from scratch, replacing manual management in the AWS Console with versioned changes and creating a staging environment.
- Automated deployments with CI/CD pipelines in GitHub Actions and Bash scripts, reducing manual steps and configuration risks in production.
- Reduced total AWS costs by 20% by cutting CloudWatch spend by 75% (US$120 to US$30 per month), identifying and disabling unused IoT Core logs.
- Analyzed Lambda error metrics in CloudWatch and fixed unhandled edge cases, reducing average errors from 113 to 5 per five-minute interval.

PROJECTS

Sunlog.dev

Production devlog platform with 33 REST endpoints, PostgreSQL, 100+ tests, GitHub Actions CI/CD, Docker, Nginx, and Prometheus/Grafana observability.

Technologies: NestJS, PostgreSQL, Docker, Nginx, AWS, GitHub Actions, Prometheus, Grafana, Next.js

Code | Live demo

PocScript

Programming language and compiler implemented in C, covering the full compilation pipeline: lexical analysis, AST parsing, semantic analysis, custom IR generation, LLVM IR emission, and native executable generation. Includes a Linux syscall-based runtime, type system, scope resolution, arrays, pointers, and a suite with 196 unit and integration tests.

Technologies: C, LLVM IR, NASM, Make, Linux syscalls, Compiler Design

Code

EDUCATION

Bachelor of Computer Science - PUCPR 02/2025 - 12/2028

Full scholarship. Coursework: algorithms, data structures, operating systems, networks, databases, and software engineering.

Technical High School in Electronics - CEEP 02/2022 - 12/2024

LANGUAGES

- **Portuguese:** Native
- **English:** Professional proficiency
