SUMMARY

Junior Backend Developer with experience in AWS production environments, working on REST API development, distributed systems, and event-driven integrations. I work with Python, Node.js, and TypeScript, with a focus on code quality, automated testing, infrastructure automation, CI/CD pipelines, and observability.

TECHNICAL SKILLS

- **Backend:** Node.js, TypeScript, Python, NestJS, FastAPI
- **Databases:** PostgreSQL, MySQL, DynamoDB
- **Cloud & DevOps:** AWS Lambda, S3, SQS, EC2, RDS, IoT Core, CloudWatch, Terraform, GitHub Actions, Docker
- **Frontend:** React, Next.js, TailwindCSS

EXPERIENCE

Backend Developer - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 10/2026 - Present

- Lead the consolidation of multiple AWS Lambda functions into a single FastAPI API organized into services and repositories, reducing deployment time from approximately 12 to 5 minutes and latency on several endpoints from 7–10 seconds to approximately 1.5 seconds (79–85%).
- Redesigned AWS network architecture, replacing multiple VPC endpoints with a NAT Gateway and adding an EC2 bastion for database access, reducing monthly network costs by approximately 64% (US\$90 to US\$32) and expanding Lambda connectivity.
- I am restructuring the MySQL schema of a production IoT platform, remodeling entities, relationships, and migration flows to better reflect the domain and preserve integrity and compatibility during transition.

Backend Developer Intern - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 10/2024 - 09/2026

- Developed an endpoint for data migration between IoT devices, integrating MySQL, DynamoDB, S3, and AWS IoT Core through MQTT, supporting thousands of historical records per operation.
- Built an automated test suite for FastAPI APIs with pytest and Testcontainers, including 120 integration tests and 300 unit tests, increasing delivery reliability and reducing production regression risk.
- Participated in the first phase of consolidating multiple serverless functions into a FastAPI application, reducing operational complexity and centralizing business rules.
- Introduced asynchronous, event-driven processing with Amazon SQS, handling peaks above 40,000 notifications per day and removing blocking operations from the main flow.
- Analyzed Lambda error metrics in CloudWatch and fixed unhandled edge cases, reducing average errors from 113 to 5 per five-minute interval.

PROJECTS

Sunlog.dev

Production devlog platform with an architecture based on REST APIs, PostgreSQL, and automated AWS infrastructure. Includes a backend with 33 HTTP endpoints, more than 100 automated tests, CI/CD with GitHub Actions, Docker containerization, Nginx reverse proxy, and observability with Prometheus and Grafana.

Technologies: NestJS, PostgreSQL, Docker, Nginx, AWS, GitHub Actions, Prometheus, Grafana, Next.js

[Code](#) | [Live demo](#)

PocScript

Programming language and compiler implemented in C, covering the full compilation pipeline: lexical analysis, AST parsing, semantic analysis, custom IR generation, LLVM IR emission, and native executable generation. Includes a Linux syscall-based runtime, type system, scope resolution, arrays, pointers, and a suite with 196 unit and integration tests.

Technologies: C, LLVM IR, NASM, Make, Linux syscalls, Compiler Design

EDUCATION

Bachelor of Computer Science - PUCPR 02/2025 - 12/2028

Full scholarship (100%). Coursework focused on algorithms, data structures, operating systems, computer networks, databases, and software engineering.

Technical High School in Electronics - CEEP 02/2022 - 12/2024

LANGUAGES

- **Portuguese:** Native
- **English:** Professional Working Proficiency
