SUMMARY

Mid-Level Backend Developer with experience in AWS production environments, working on REST API development, distributed systems, and event-driven integrations. I work with Python, Node.js, and TypeScript, with a focus on code quality, automated testing, infrastructure automation, CI/CD pipelines, and observability.

TECHNICAL SKILLS

- Backend:** Node.js, TypeScript, Python, NestJS, FastAPI
- Databases:** PostgreSQL, MySQL, DynamoDB
- Cloud & DevOps:** AWS Lambda, S3, SQS, EC2, RDS, IoT Core, CloudWatch, Terraform, GitHub Actions, Docker
- Frontend:** React, Next.js, TailwindCSS

EXPERIENCE

Backend Developer - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 10/2026 - Present

- Lead the consolidation of multiple AWS Lambda functions into a single FastAPI API organized into services and repositories, reducing deployment time from approximately 12 to 5 minutes and latency on several endpoints from 7–10 seconds to approximately 1.5 seconds (79–85%).
- Redesigned AWS network architecture, replacing multiple VPC endpoints with a NAT Gateway and adding an EC2 bastion for database access, reducing monthly network costs by approximately 64% (US\$90 to US\$32) and expanding Lambda connectivity.
- I am restructuring the MySQL schema of a production IoT platform, remodeling entities, relationships, and migration flows to better reflect the domain and preserve integrity and compatibility during transition.

Backend Developer Intern - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 10/2024 - 09/2026

- Introduced asynchronous, event-driven processing with Amazon SQS, handling peaks above 40,000 notifications per day and removing blocking operations from the main flow.
- Built an automated FastAPI test suite with pytest and Testcontainers, including 120 integration tests and 300 unit tests, improving delivery reliability.
- Developed an endpoint for data migration between IoT devices, integrating MySQL, DynamoDB, S3, and AWS IoT Core through MQTT and supporting thousands of historical records per operation.
- Analyzed Lambda error metrics in CloudWatch and fixed unhandled edge cases, reducing average errors from 113 to 5 per five-minute interval.
- Automated deployments with CI/CD pipelines in GitHub Actions and Bash scripts, reducing manual steps and configuration risks in production.

PROJECTS

Sunlog.dev

Production devlog platform with an architecture based on REST APIs, PostgreSQL, and automated AWS infrastructure. Includes a backend with 33 HTTP endpoints, more than 100 automated tests, CI/CD with GitHub Actions, Docker containerization, Nginx reverse proxy, and observability with Prometheus and Grafana.

Technologies: NestJS, PostgreSQL, Docker, Nginx, AWS, GitHub Actions, Prometheus, Grafana, Next.js

[Code](#) | [Live demo](#)

PocScript

Programming language and compiler implemented in C, covering the full compilation pipeline: lexical analysis, AST parsing, semantic analysis, custom IR generation, LLVM IR emission, and native executable generation. Includes a Linux syscall-based runtime, type system, scope resolution, arrays, pointers, and a suite with 196 unit and integration tests.

Technologies: C, LLVM IR, NASM, Make, Linux syscalls, Compiler Design

EDUCATION

Bachelor of Computer Science - PUCPR 02/2025 - 12/2028

Full scholarship (100%). Coursework focused on algorithms, data structures, operating systems, computer networks, databases, and software engineering.

Technical High School in Electronics - CEEP 02/2022 - 12/2024

LANGUAGES

- Portuguese:** Native
- English:** Professional proficiency
