SUMMARY

DevOps-focused backend developer with production experience in AWS, infrastructure automation, CI/CD pipelines, observability, and distributed systems. Hands-on with Python, TypeScript, FastAPI, Docker, Terraform, Linux, relational databases, and event-driven services, with a focus on making delivery safer, more reliable, and easier for development teams.

TECHNICAL SKILLS

- **Languages & Backend:** Python, TypeScript, Node.js, FastAPI, NestJS, REST APIs
- **Cloud & Infrastructure:** AWS Lambda, S3, SQS, EC2, RDS, IoT Core, CloudWatch, Terraform, Docker, Linux
- **CI/CD & Automation:** GitHub Actions, Bash, automated deployments, source control workflows, infrastructure as code
- **Databases:** PostgreSQL, MySQL, DynamoDB
- **Distributed Systems & Observability:** Event-driven architecture, MQTT, queues, load-aware async processing, Prometheus, Grafana, CloudWatch
- **Testing:** pytest, Jest, Testcontainers, unit tests, integration tests

EXPERIENCE

Backend Developer Intern - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 09/2024 - Present

- Structured infrastructure as code with Terraform from scratch, replacing manual management in the AWS Console with versioned changes and creating a staging environment.
- Automated deployments with CI/CD pipelines in GitHub Actions and Bash scripts, reducing manual steps and configuration risks in production.
- Reduced infrastructure costs by 20% through CloudWatch metrics analysis and removal of idle resources.
- Optimized Python AWS Lambda functions, reducing the average number of errors every 5 minutes from 113 to 5 (95.6%) and significantly increasing production system reliability.
- Participated in the consolidation of multiple serverless functions into a FastAPI monolithic API, reducing operational complexity, centralizing business rules, and improving system maintainability.
- Introduced asynchronous processing with Amazon SQS to implement event-driven communication between services, processing spikes above 40,000 notifications per day and eliminating blocking operations from the main request flow.

PROJECTS

Sunlog.dev

Production devlog platform built around REST APIs, PostgreSQL, and automated AWS infrastructure. Includes a backend with 33 HTTP endpoints, 100+ automated tests, CI/CD with GitHub Actions, Docker-based deployment, Nginx reverse proxy, and observability with Prometheus and Grafana.

Technologies: NestJS, PostgreSQL, Docker, Nginx, AWS, GitHub Actions, Prometheus, Grafana, Next.js

[Code](#) | [Live demo](#)

PocScript

Programming language and compiler implemented in C, covering the full compilation pipeline: lexical analysis, AST parsing, semantic analysis, custom IR generation, LLVM IR emission, and native executable generation. Includes a Linux syscall-based runtime, type system, scope resolution, arrays, pointers, and a suite with 196 unit and integration tests.

Technologies: C, LLVM IR, NASM, Make, Linux syscalls, Compiler Design

EDUCATION

Bachelor of Computer Science - PUCPR 02/2025 - 12/2028

Full scholarship. Coursework focused on algorithms, data structures, operating systems, computer networks, databases, and software engineering.

Technical High School in Electronics - CEEP 02/2022 - 12/2024

CERTIFICATIONS

- **Fundamentals of Database Engineering** - Hussein Nasser, Udemy | Sep/2025

LANGUAGES

- **Portuguese:** Native
- **English:** Professional proficiency
