SUMMARY

Mid-Level Backend Developer with experience in AWS production environments, working on REST API development, distributed systems, and event-driven integrations. I work with Python, Node.js, and TypeScript, with a focus on code quality, automated testing, infrastructure automation, CI/CD pipelines, and observability.

TECHNICAL SKILLS

- **Backend:** Node.js, TypeScript, Python, NestJS, FastAPI
- **Databases:** PostgreSQL, MySQL, DynamoDB
- **Cloud & DevOps:** AWS Lambda, S3, SQS, EC2, RDS, IoT Core, CloudWatch, Terraform, GitHub Actions, Docker
- **Frontend:** React, Next.js, TailwindCSS

EXPERIENCE

Backend Developer Intern - SmartLy Fabricação de Dispositivos Inteligentes Ltda. 09/2024 - Present

- Led in the consolidation of multiple serverless functions into a FastAPI monolithic API, reducing operational complexity, centralizing business rules, and improving system maintainability.
- Introduced asynchronous processing with Amazon SQS to implement event-driven communication between services, processing spikes above 40,000 notifications per day and eliminating blocking operations from the main request flow.
- Implemented an automated test suite for FastAPI APIs with pytest, including 30 integration tests with Testcontainers and 80 unit tests, increasing delivery reliability and reducing the risk of production regressions.
- Developed an endpoint for data migration between IoT devices, integrating MySQL, DynamoDB, S3, and AWS IoT Core through MQTT and supporting the migration of thousands of historical records per operation.
- Optimized Python AWS Lambda functions, reducing the average number of errors every 5 minutes from 113 to 5 (95.6%) and significantly increasing production system reliability.
- Automated deployments with CI/CD pipelines in GitHub Actions and Bash scripts, reducing manual steps and configuration risks in production.

PROJECTS

Sunlog.dev

Production devlog platform with an architecture based on REST APIs, PostgreSQL, and automated AWS infrastructure. Includes a backend with 33 HTTP endpoints, more than 100 automated tests, CI/CD with GitHub Actions, Docker containerization, Nginx reverse proxy, and observability with Prometheus and Grafana.

Technologies: NestJS, PostgreSQL, Docker, Nginx, AWS, GitHub Actions, Prometheus, Grafana, Next.js

[Code](#) | [Live demo](#)

PocScript

Programming language and compiler implemented in C, covering the full compilation pipeline: lexical analysis, AST parsing, semantic analysis, custom IR generation, LLVM IR emission, and native executable generation. Includes a Linux syscall-based runtime, type system, scope resolution, arrays, pointers, and a suite with 196 unit and integration tests.

Technologies: C, LLVM IR, NASM, Make, Linux syscalls, Compiler Design

EDUCATION

Bachelor of Computer Science - PUCPR 02/2025 - 12/2028

Full scholarship (100%). Coursework focused on algorithms, data structures, operating systems, computer networks, databases, and software engineering.

Technical High School in Electronics - CEEP 02/2022 - 12/2024

CERTIFICATIONS

- **Fundamentals of Database Engineering** - Hussein Nasser, Udemy | Sep/2025

LANGUAGES

- **Portuguese:** Native
- **English:** Professional proficiency
